DATA QUALITY ANALYSIS

HB 2067 DATA QUALITY & COMPLIANCE MONITORING DASHBOARD

The HB 2067 Data Quality & Compliance Monitoring dashboard provides a centralized strategic view of underwriting data health relative to Texas statutory reporting mandates.

It features high-level KPI scorecards for completeness, deduplication, and TDI compliance, alongside a combo chart that tracks severity-based anomalies over a multi-year period.

Stakeholders can expect a tactical Exception Queue that prioritizes high-severity logical date errors to facilitate mandated 24-hour remediation.

This tool transforms raw insurance data into actionable regulatory insights, ensuring organizational readiness for Texas Department of Insurance (TDI) audits.

DATA QUALITY & COMPLIANCE MONITORING OVERVIEW

Overall Completeness %

90.01%

Duplicate Rate %

0.00%

0.0% of 0.91% Duplicate Rate %

TDI Error Rate %

8.09%

ZIP Error Rate %

1.90%

Overall Completeness %

Tracks the population of mandatory regulatory fields across all policy actions. This 90.01% baseline ensures high-fidelity data for statutory reporting and state audits.

Duplicate Rate %

Validates the 100% removal of redundant policy instances via the BigQuery deduplication pipeline. This prevents artificial inflation of policy counts in compliance filings.

TDI Error Rate %

Monitors adverse actions missing valid statutory reason codes. At 8.09%, this identifies a critical variance from the 1.0% Texas Department of Insurance (TDI) threshold.

ZIP Error Rate %

Identifies malformed or non-Texas property ZIP codes within the dataset. This metric ensures geographic precision for territory-based risk assessments and regional reporting accuracy.

Missing/Invalid TDI Code

728

Invalid ZIP Codes

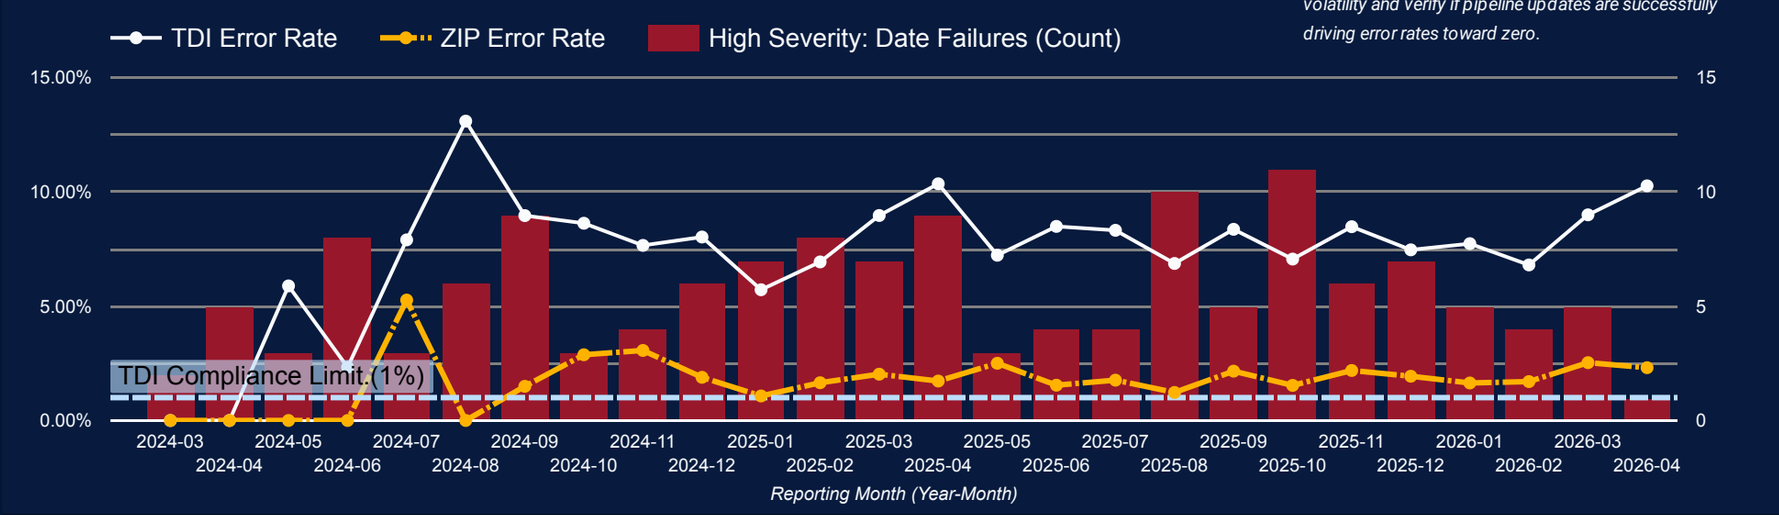
167

Logical Date Errors

145

DATA QUALITY ANOMALIES OVER TIME

This visualization correlates high-severity date logic failures with broader field error rates across the reporting lifecycle. It enables stakeholders to isolate specific periods of system volatility and verify if pipeline updates are successfully driving error rates toward zero.



EXCEPTION QUEUE: RECORDS REQUIRING REMEDIATION

A tactical action list that isolates individual records failing statutory validation, prioritized by high-severity date logic errors. This serves as the primary operational tool for the Underwriting team to execute 24-hour remediation as mandated by JIRA DQ-1042.
